

**SUSTEM DA** is a deliming agent based on acidic salts of polybasic-aromatic acids.

### Properties

Chemical Composition	:	Acidic salts of polybasic-aromatic acids
Appearance	:	White Powder
pH(10% Solution)	:	1.50 – 1.80
Charge	:	---

### Features

- SUSTEM DA gives rise to a very quick reduction in swelling, which largely prevents them from being scuffed when they are drummed. Unlike conventional ammonium salts, it also release the lime that is trapped in the capillaries.
- It forms calcium salts that dissolve easily. Improves the cleaning of ground and other keratinous substances, which are released along with the water when the pelts contract. Produces full leather with a clean, smooth, tight and fine grain.
- SUSTEM DA a non swelling deliming agent is recommended for rapid deliming of thick, unsplit pelts. SUSTEM DA is suitable for all types of raw stock and for the production of all types of leather. The product speeds up the deliming process and gives leather with a very fine, tight grain and superior fullness.

### Application

SUSTEM DA can be applied alone or in combination with other ammonium salts. We would recommend deliming cattlehide in a short float at approx 30°C. SUSTEM DA can be applied as a powder or it can be diluted in advance.

SUSTEM DA can be combined very effectively with the enzymatic bating agents. The bating agent is generally added at the end of the deliming process. The ideal pH value for this can be obtained by adding more SUSTEM DA.

### Storage / Shelf Life

SUSTEM DA can be stored for six months under normal conditions.

### Packaging

25 Kgs Bag
